# N - Queen Problem

Date :

AIM :

To solve the N-Queens problem by identifying all valid configurations or finding at least one solution, depending on requirements.

ALGORITHM :

Step - 1 : Start

Step - 2 : Create an  $N \times N$  board with all positions set to 0.

Step - 3 : For each column, try placing a queen in each row.

Step - 4 : check if the position is safe using the `isSafe()` function (no queen in the same row, column, or diagonal)

Step - 5 : If placing the queen is safe, mark the position with a 1.

Step - 6 : If no valid placement is found, backtrack by removing the queen and try a new position.

Step - 7 : If queens are placed in all columns, print the board.

Step - 8 : If no placement is possible, print "Solution does not exist".

Step - 9 : Stop.

CODE :

```
def printSolution(board):  
    for i in range(N):  
        for j in range(N):  
            if board[i][j] == 1:
```

```
Print ("Q", end = ' ')
```

```
else:
```

```
Print ('-', end = ' ')
```

```
Print()
```

```
def isSafe(board, row, col):
```

```
    for i in range(col):
```

```
        if board[row][i] == 1:
```

```
            return False
```

```
    for i, j in zip(range(row, -1, -1), range(col, -1, -1)):
```

```
        if board[i][j] == 1:
```

```
            return False
```

```
    for i, j in zip(range(row, N, 1), range(col, -1, -1)):
```

```
        if board[i][j] == 1:
```

```
            return False
```

```
    return True
```

```
def SolveNQUtil(board, col):
```

```
    if col >= N:
```

```
        return True
```

```
    for i in range(N):
```

```
        if isSafe(board, i, col):
```

```
            board[i][col] = 1
```

```
            if SolveNQUtil(board, col+1):
```

```
                return True
```

```
            board[i][col] = 0
```

```
    return False
```

```
def SolveNQ():
```

```
    global N
```

```
    N = Input("Enter the number: ")
```

```
    board = [[0 for i in range(N)] for j in range(N)]
```

```
    if SolveNQUtil(board, 0) == False:
```

```
        print("solution does not exist")
```

```
    return False
```

PrintSolution (board)

return True

Solve NQ()

MIA

Algorithm

Output:

Enter the number : 3

Solution does not exist

Enter the number : 4

- - Q -

Q - - -

- - - Q

- Q - -

RESULT:

The program has been successfully executed and the output is verified.
